SE 461 Computer Vision

Nazar Khan PUCIT

Lecture 1: Course Introduction and Basics

Disclaimer!

- Many of the lecture slides during this course will heavily borrow material from people I learned from, especially
 - Dr. Sohaib Khan
 - Dr. Joachim Weickert

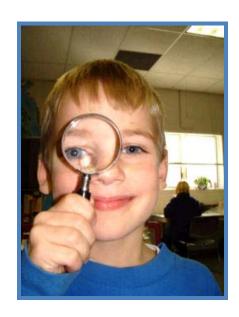

Lecture Etiquette

On Questions

- There is no such thing as a 'stupid question'.
- Your questions will help your class-mates.
- Your questions will make sure I do not go too fast.
- Your questions provide feedback for me.

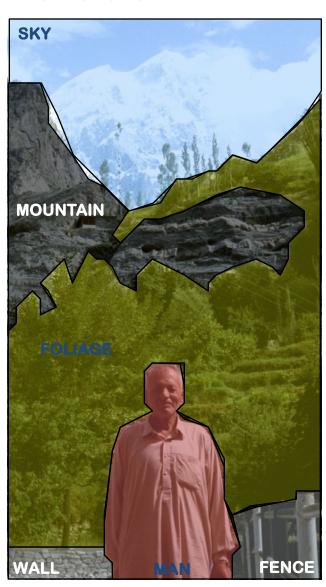

Introduction

- Sight is our primary sensation
 - 80% of our first 12 years of learning is through vision
 - 40% of the brain is dedicated to visual processing
- Human (and Animal) Experience

What does it mean to see?

- "To know what is where by looking"
 - -- Aristotle
- Computer Vision Scientist: "How do we build a machine to do that?"
- Scientifically unsatisfactory
 - What is "what"?
 - What is "where"?
- Ongoing investigation
 - Identification
 - Localization

What do you see?

What *colors* do you see?

What *letters* do you see?

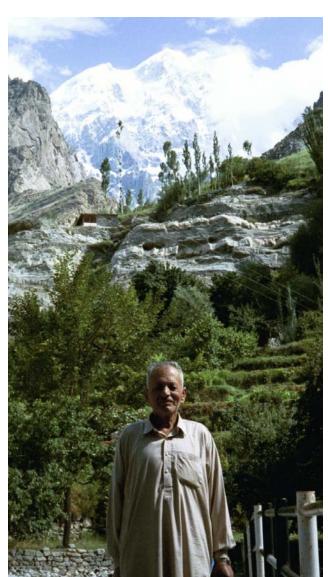

Do you see a grid of tiles?

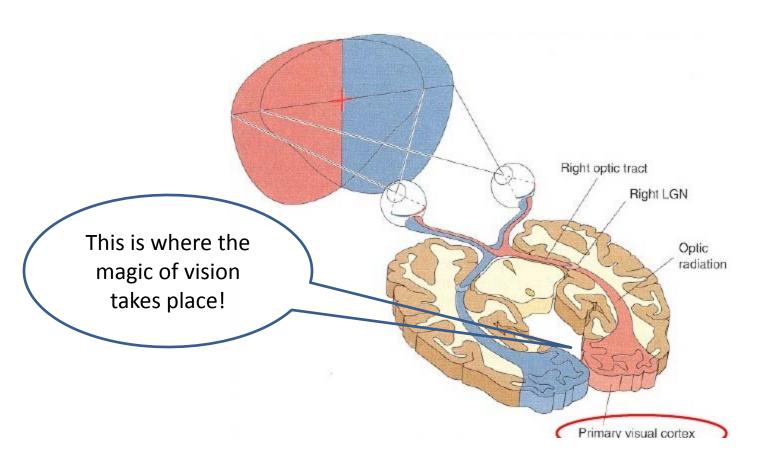

Biological Vision

- Biological Vision is a <u>very</u> <u>sparse</u> process.
- Everything entering your eye
 ≠ What you see.
- Our brains choose only the most crucial information
 - and that is what we "see"

Where in the brain do we see?

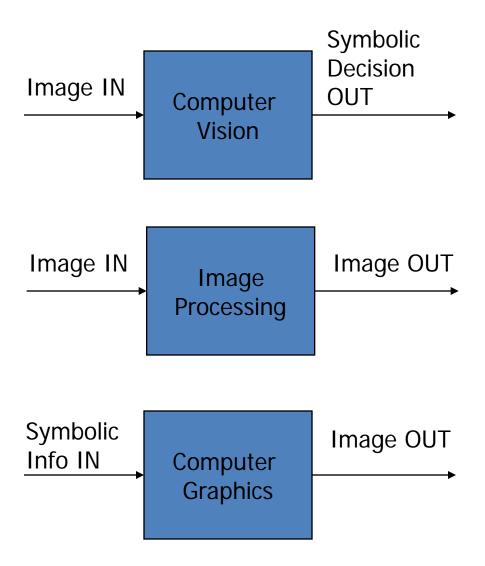

The visual pathway (http://www.slideshare.net/Codeye/visual-pathway)

What is Computer Vision?

- "The goal of Computer Vision is to make useful decisions about real physical objects and scenes from their images"
- "What's in the image?"
- "What's happening in the video?"

CV vs IP vs CG

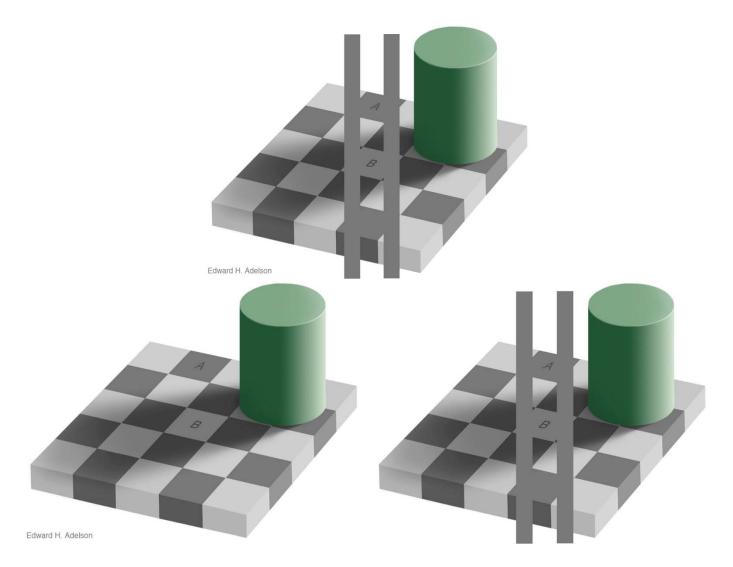

What is computer vision? Machine Neurobiology **Optics Statistics** Geometry Learning **Image Artificial Processing Computer Vision** Intelligence **Virtual Medical** Document Robotic Many more Surveillance Reality **Imaging Analysis Control**

Why is computer vision hard?

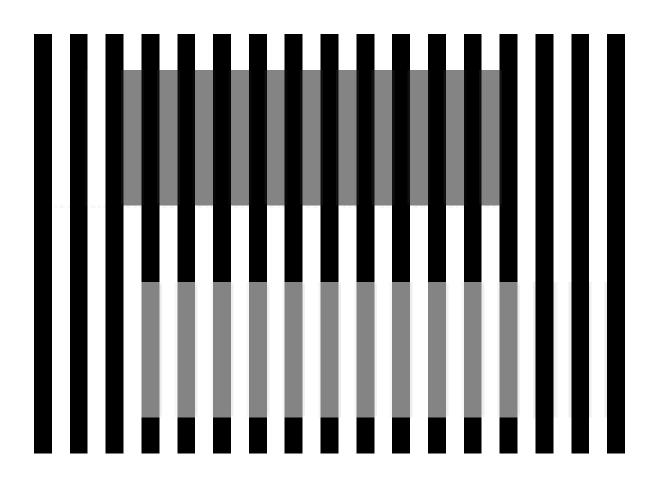

- Computers are good at numerical processing
- Humans are good at perceptual processing

 We want to use a computer to mimic human perception... which is complex to understand

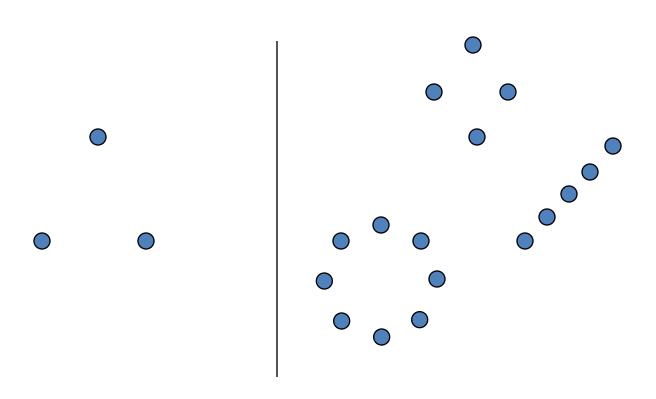

Perception

Perception

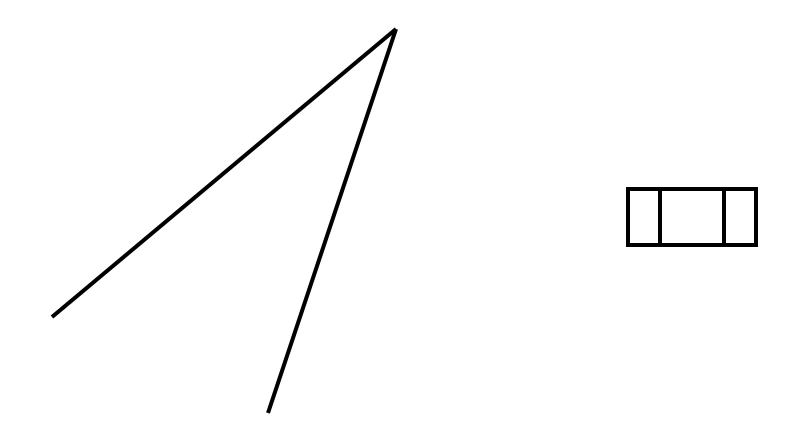

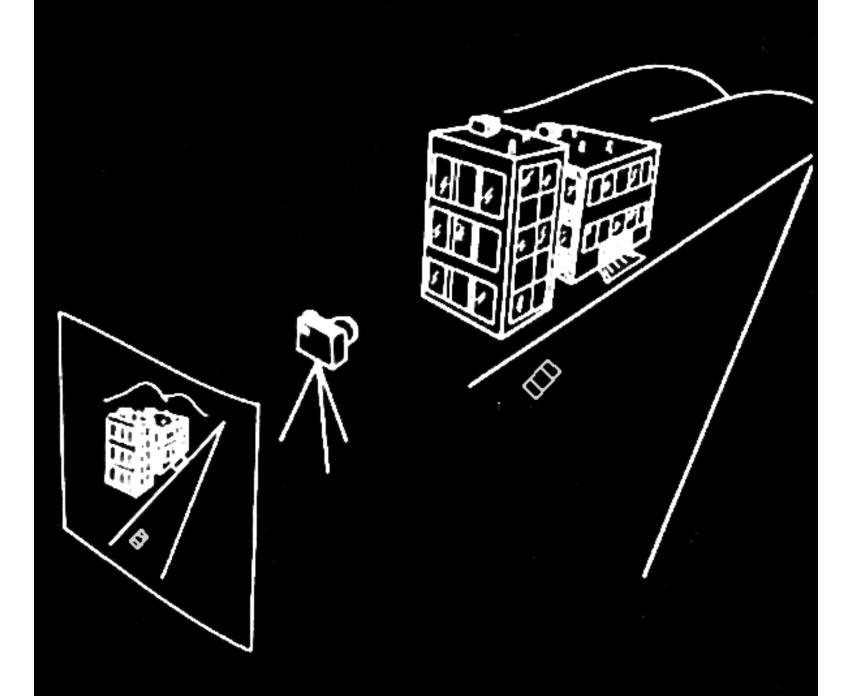

Perception

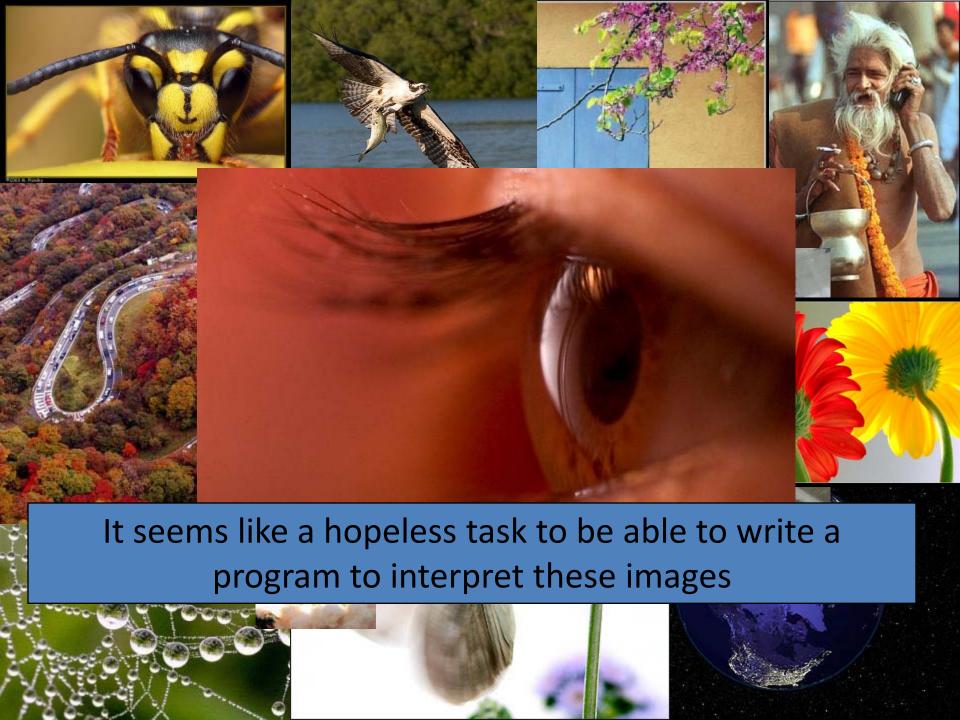

Ref: Light and Vision: LIFE Science Library

What is this?

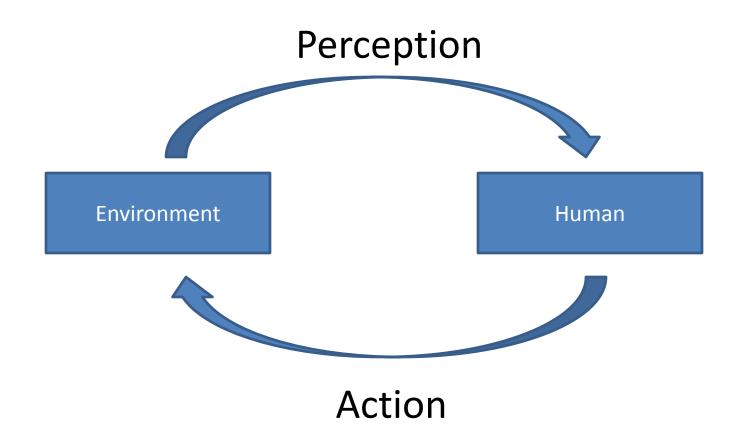

Writing Programs that "See"

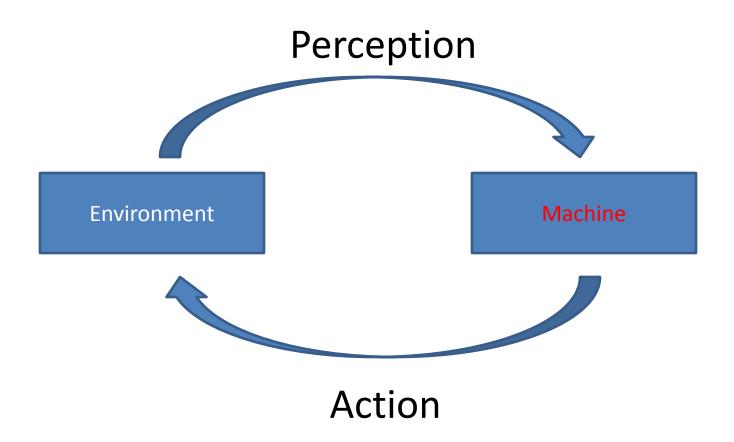

An Example

Motivation

- Humans have highly sophisticated capabilities of sensing the environment, interpreting it and taking actions accordingly.
- Human Perception: "the process of attaining awareness or understanding of sensory inform ation"
- Can machines have similar capabilities?
 - Can we write <u>algorithms</u> for perception?

The Perception-Action Cycle

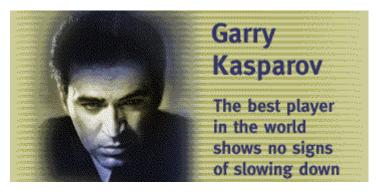

Motivation

Machines Compute

Humans Perceive

Can perception arise from computation?

Gary Kasparov vs. Deep Blue (1997)

- Can evaluate about 3 positions per second
- Large chess 'knowledge', low computation ability
- Uses a lot of intuition and feeling
- Learns and adapts very quickly from his mistakes
- Can get bored, fatigued, loss of concentration
- Highly intelligent
- Selective searching of positions

- Can evaluate about 200,000,000 positions per second
- Small chess knowledge, high computation ability
- Uses only computations
- Not a learning system (machine learning algorithms were not used)
- Not affected by feelings such as Kasparov's stare
- Dumber than a 2 year old
- Brute-force evaluation of all moves

http://www.research.ibm.com/deepblue/

Why is Perception Difficult for Computational Machines?

- Example Problem:
 - Given an image, search through all possible subwindows and identify those which contain a human face

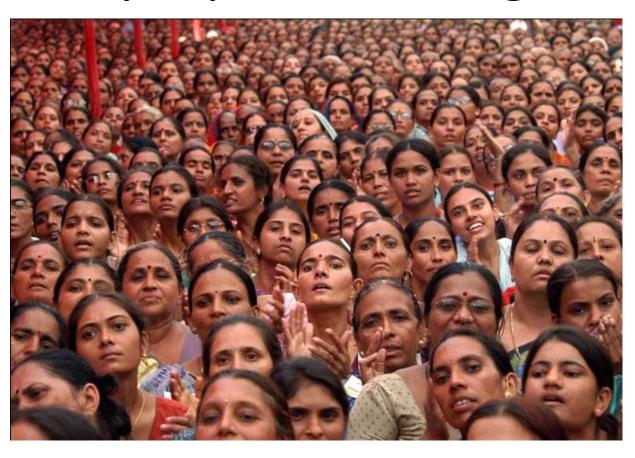

Face Detection Problem

Why is pattern recognition hard?

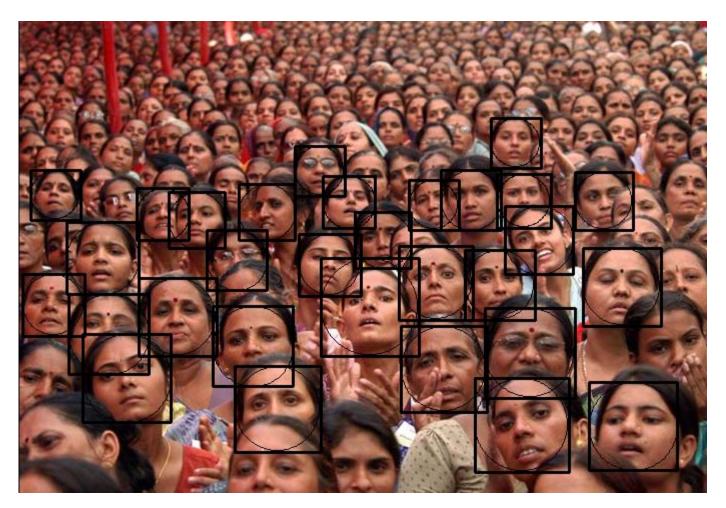

- To write an algorithm, you may need to precisely define a human face
- Your description should be invariant to pose, 3D rotation, occlusion, race, gender
- The description should hold for all faces and nothing which is not a face should match the description

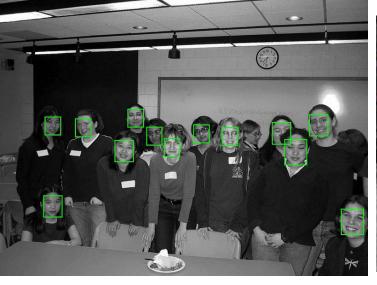

IMPOSSIBLE?

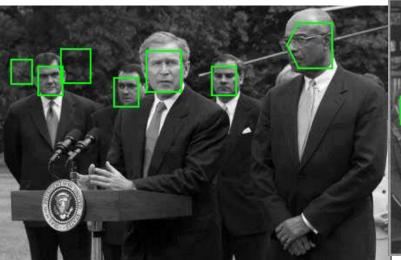

- "If it were not for the human existence proof, we would have given up a long time ago"
 - We do it, so there MUST be some method behind it.
- Computer Vision usually does not follow Biological Vision
 - It's just too complex!!!
 - Our brains are massively parallel processors

State of the Art in Face Detection

Solving Sub-problems

- The study of Computer Vision started with the effort of trying to make complete visual understanding systems
 - Initially, it was considered an easy problem
 - Marvin Minsky gave the visual perception problem as a summer project to a sophomore
- Complete Scene Understanding Systems
 - VISIONS, Hansen and Riseman, 1978
 - ACRONYM, Brooks and Binford, 1979
- Did not succeed
 - Too complex a problem
 - Lack of computational power
 - Lack of data
- We have been trying to solve sub-problems
 - The researchers will return to the complete problem at a later date

Reconstruction of 3D Structure

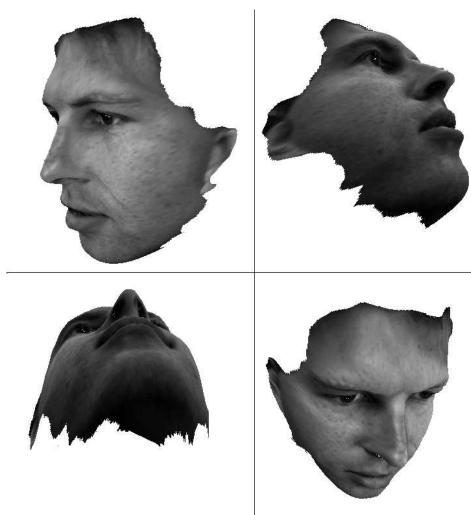

- An Image is a 2-Dimensional projection of 3D World
- 3D can be reconstructed from
 - Two images
 - Stereo Problem
 - Video with moving camera
 - Structure from Motion Problem
 - Some understanding about what is being viewed
 - Geometrical inference
 - Shape from shading or texture

Stereo

Stereo image pair.

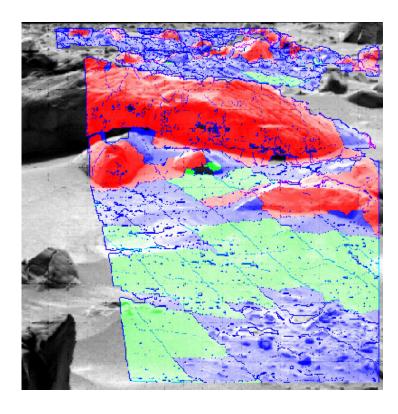

3-D reconstructions
